

Project 0 Self Analysis

5.1 What was the hardest part of the assignment for you?

The hardest part of this assignment for me was adjusting to some of the Python syntax. A few time I would write things like “&&” rather than “and” and get errors. Even though what I was trying to do in this code was logically quite simple, it took much longer than it otherwise would because I had to read about the specifics of the syntax.

5.2 What was the easiest part of the assignment for you?

As mentioned above, despite a few hiccups with adjusting to the language, the code was at its core very simple. I quickly knew exactly how to implement these functions in terms of their basic logic, it was just a matter of writing it the right way (which of course is the point of this assignment: getting a better grasp on Python).

5.3 What problem(s) helped further your understanding of the course material?

Question 1 didn't really help me understand much, since I already knew how to copy and paste, as well as run Python code. Question 2 gave me a better understanding of how to index into tuples and dictionaries. Question 3 was probably the most educational question for me. I had to pay a bit more attention to the types we were using, and how importing works. I also learned how to check if a variable is None.

5.4 Did you feel any problems were tedious and not helpful to your understanding of the material?

Nothing in this assignment was too tedious since it was fairly short and simple. Not everything was incredibly helpful, but this assignment is just about quickly making sure we know the basics.

5.5 What other feedback do you have about this homework?

It's a fairly good tutorial for its short length. It definitely exposed what I don't solidly know about the basics of Python, while being easy enough.
